GRAPHS PAGE

The graph visualises relationships between articles and the companies mentioned within them. Node sizes are determined by relevance: for company nodes, size correlates with the frequency of article mentions, while for article nodes, it reflects the count of mentioned companies.

Article nodes also display the average sentiment of all referenced companies, influencing their colour. Company nodes are uniformly coloured blue. Additionally, the colour of the connecting edges mirrors the sentiment of the associated entity in the article, providing a comprehensive sentiment overview at a glance.
